Problem 1

We have that

$$\beta = \arctan\left(\frac{l_r}{l_r + l_f} \tan(u)\right)$$

therefore

$$\tan(\beta) = \frac{l_r}{l_r + l_f} \tan(u)$$

therefore since the range of \tan is $-\infty$ to ∞ for any β we can find a u that satisfies the equation.

Problem 2

We have that

$$\frac{d}{dt}y = v \sin(\psi + \beta)$$

$$\frac{d}{dt}\psi = \frac{v}{l_R} \sin(\beta)$$

$$\beta = \arctan\left(\frac{l_r}{l_r + l_f} \tan(u)\right)$$

Linearizing around $\psi = 0$ $\beta = 0$, we have

$$\frac{d}{dt}y = v(\psi + \beta)$$

$$\frac{d}{dt}\psi = \frac{v}{l_R}\beta$$

therefore taking the laplace transform we have

$$sY = v(\psi + \beta)$$

$$s\psi = \frac{v}{l_r}\beta$$

Therefore we get

$$sY = v\left(\frac{v}{l_r s} + 1\right)\beta$$

Therefore the transfer function is

$$\frac{Y(s)}{\beta} = \frac{v(v + l_r s)}{l_r s^2}$$

So now with a controller $D_c(s)$ and unity feedback we have that the transfer function is

$$\frac{Y}{R} = \frac{D_c(s) \frac{v(v+l_r s)}{l_r s^2}}{1 + D_c(s) \frac{v(v+l_r s)}{l_r s^2}}$$

Therefore the error is

$$E(s) = R(s) - Y(s) = R(s) - \frac{D_c(s) \frac{v(v+l_r s)}{l_r s^2}}{1 + D_c(s) \frac{v(v+l_r s)}{l_r s^2}} R(s)$$

To model a disturbance of length d starting at time t_1 and ending at time t_2 , we let $r(t) = du(t - t_1) - du(t - t_2)$. and let the controller be a simple k_p controller.

simulating in simulink with $k_p = 1$ and $d = 1$ and $t_1 = 4$ and $t_2 = 6$, we get the following plot for $y(t)$.

As we can see, the controller stabilizes the car at $y = 0$.
